

Mutoh Valuejet 426UF Workflow with Windows driver & Layer Editor

1. Use a software that is capable of working with layers .
(Illustrator, Photoshop, Coreldraw, etc ...)

2. Create 4 separate layers.
Varnish, Color, White and in case you are using a jig, use the digital layout from the jig as a position layer.

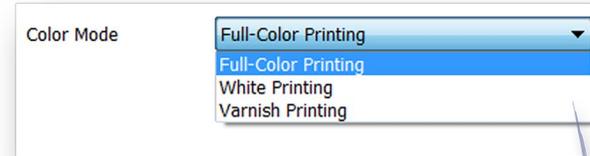

Note : It is not a must to use vector based software, but in case your image is a vector, you will have more benefits to manipulate your image when vector based software is used.

3. Create a black silhouette on the place where you want to print white or varnish (the way to do this is of course depending on the software and the image that you are using)

Mutoh Valuejet 426UF Workflow with Windows driver & Layer Editor

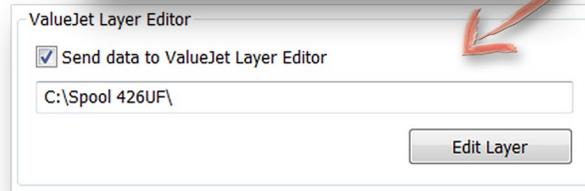

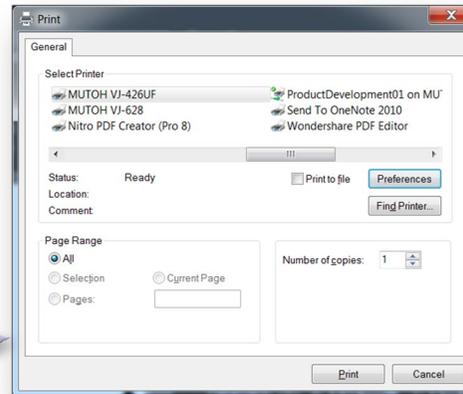

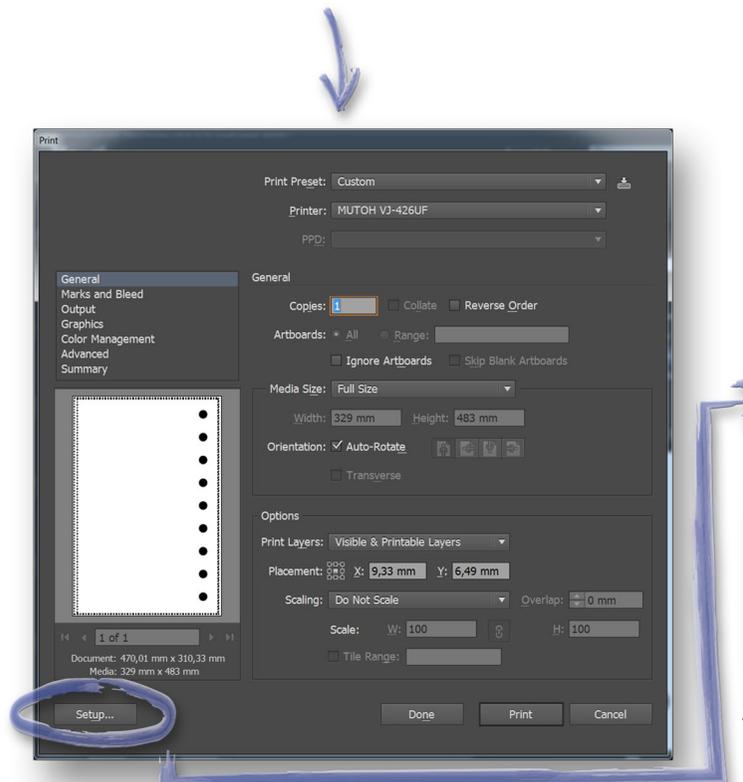

2. Choose the Color Mode that you want. In case of our example, when we activate the "Color" layer in illustrator, we will choose "Full-Color Printing" in the 426UF driver. When White or Varnish are chosen, the driver will offer you the option to set a percentage (from 0 to 100%) which will control the density of white and varnish.

1. The driver will give you the option to print color, white, or varnish, as separate prints (so in case of white-color-varnish, you will need to make 3 prints)
Activate the layer you want to print, and go to file - print for each layer.

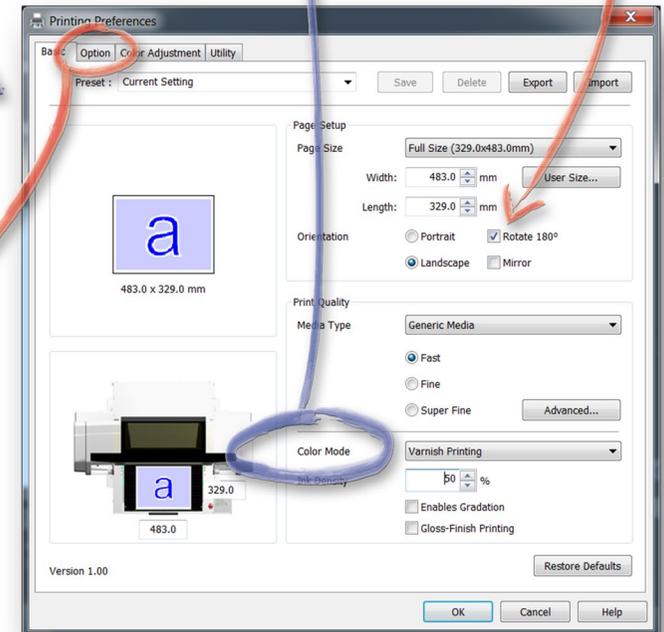

3. Check the option tab in the driver to make sure that the prints are captured by the layer editor

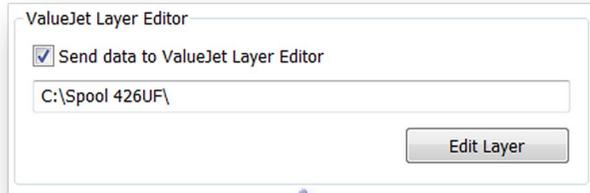

4. Don't forget to check the 180° box. This way, the onscreen preview will have the same orientation as the actual print.

5. All prints will be collected by the layer editor (for those of you who know print-to-cut, you can compare it with a cutserver)

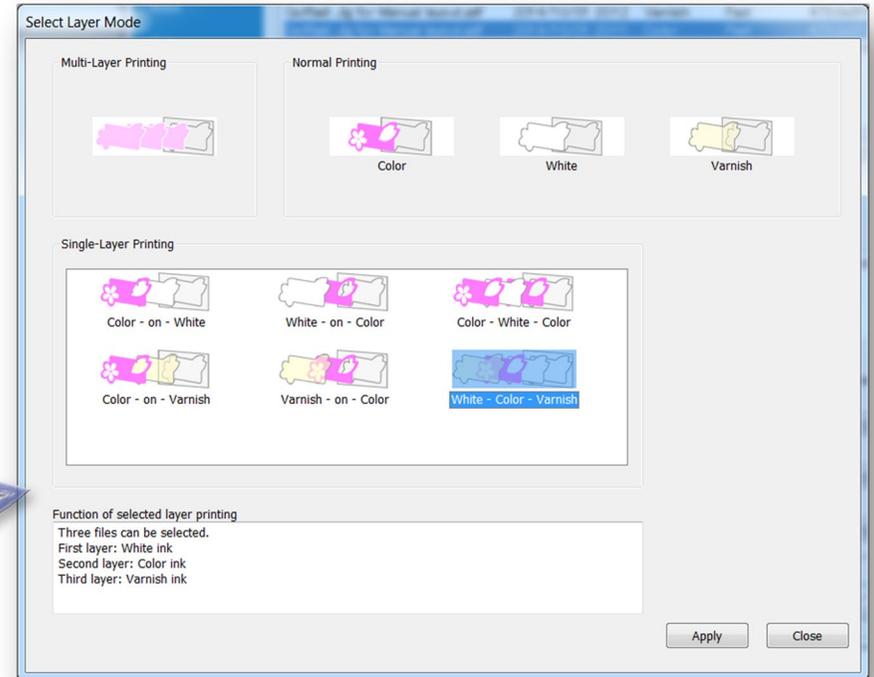

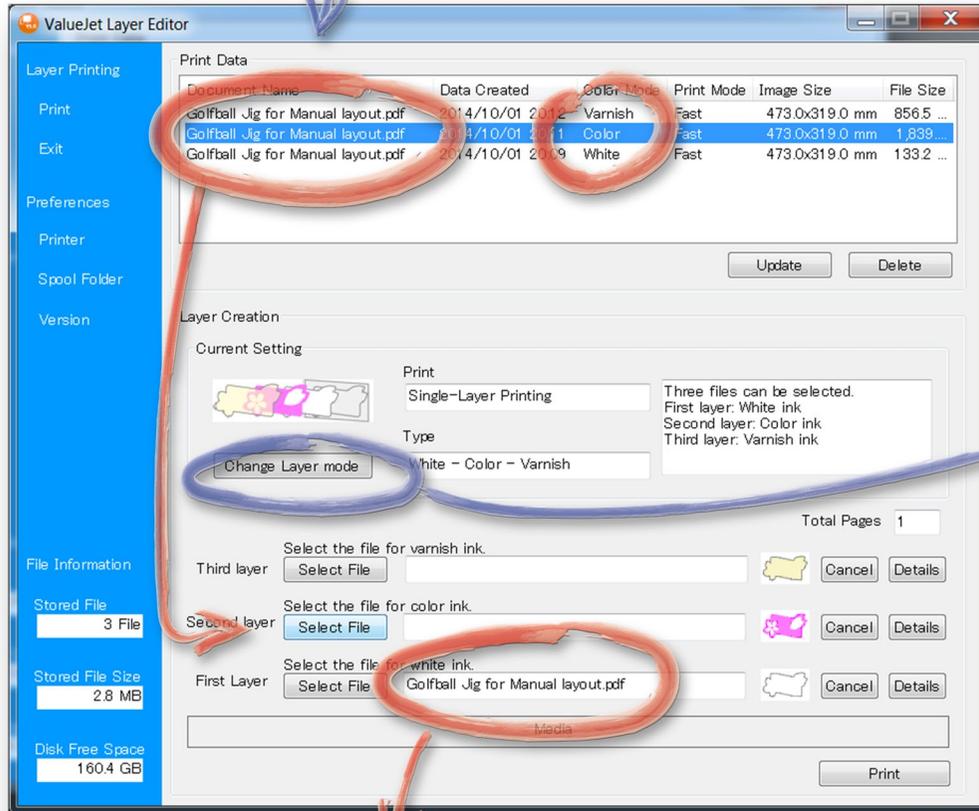

Mutoh ValueJet 426UF Workflow with Windows driver & Layer Editor

1. The files which are stored in the spool folder appear with their document name and color mode in the layer editor when the update button is clicked.

2. The Layer mode allows you to determine which ink is used under or over other ink, in case you are printing with white, color and varnish. You can also print in a single layer, for example when color only is needed.

3. Choose the layer mode (the order in which color, white and varnish are used) and assign the files in the queue to the layer fields (first layer, second layer and third layer)

4. Set the media on your 426UF printer, click the **Print** button in the layer editor and your file will be printed.
